We currently offer a face to face seminar on engineered wood products for modern methods of construction. These are offered for larger practices in the UK and Ireland. Please visit our website to request a face to face seminar and find out how to take our CPD online.

Whilst every effort was made to ensure the accuracy of this publication at the time of printing, James Jones & Sons cannot be held responsible for changes to Building Regulations, NHBC Standards etc. For the most up-to-date information please visit our website: www.jamesjones.co.uk

Section 1

The JJI-Joist system

The JJI-Joist system is available from a network of authorised distributors throughout the UK and Ireland, who offer an estimating and design service inclusive of JJI-Joist layout plans, engineering calculations and material costings.

JJI-Joists

A JJI-Joist is a composite engineered timber joist combining 45mm deep high-grade finger jointed softwood flanges with a 9mm thick oriented strand board web. Four flange widths are available at 47, 63, 72 and 97mm wide. Using advanced technology these components are combined to produce an innovative alternative to conventional construction timber with many advantages. JJI-Joists are produced to UK preferred dimensions.

The workhorse of the system, a versatile lightweight structural member ideal for floor joists, rafters, purlins and wall studs.

JJ-Beam (Glulam)

JJ-Beam, Glue laminated timber (glulam) is a high strength and stiffness beam product that is an ideal choice for demanding applications and heavily loaded members.

JJ-LVL (Laminated Veneer Lumber)

JJ-LVL is an advanced wood product suitable for a wide range of structural applications. Available in two specifications; JJ-LVL-Beam and JJ-LVL-Rim. LVL is exceptionally strong for the most demanding of applications.

www.binderholz.com/en/

www.storaenso.com/

Metalwork

James Jones and Sons continues to work closely with the UK's leading engineered timber connector manufacturers. Only connectors approved by James Jones and Sons should be used within our system. All connectors are available from JJI-Joist distributors as part of the JJI-Joists system offer.

www.itwcp.com

www.strongtie.co.uk

Design tools

Efficiency of design, manufacturing and on-site installation is key to the success of the JJI-Joist system. Through the development of our own design and optimisation software and its integration with external design and manufacturing software, we continue to remain at the forefront of industry innovation and the push for system integration for both traditional and offsite construction.

Software

The JJI-Joist system is fully supported by three Windows™ based software packages written in the UK to provide fast and cost effective design solutions for today's construction industry.

JoistMaster is a powerful beam design tool for specification and cost analysis. To request the link to our JoistMaster software please email: jjj-joists@jamesjones.co.uk

CAD and BIM (Building Information Modelling)

The James Jones software is fully integratable into the latest industry design software allowing both the import and export of design files. We currently export complete joist layouts in compliance with BIM level 2. For more information please contact James Jones and Sons Ltd.

JJI Design is a comprehensive floor design and layout package producing detailed layout drawings, material call-offs and optimisation, installation details and export files for CAD and BIM integration. **OptiMaster** is a stock inventory and material optimisation tool aimed at improving the operational efficiency of the cutting and stock control process.

Interactive span table

A helpful interactive span table can be found on the James Jones & Sons website at www.jamesjones.co.uk/interactive-span-table

Interactive span table for floors

Enter your span and load conditions and receive a list of joists suitable for your application.

Environmental considerations

Environmental considerations are a critical factor in the production of our JJI-Joists. Our environmental management system has enabled the company to target key areas to reduce the impacts of our activities on the environment.

ISO 14001

Our commitment to ISO 14001:2015 from start-up, not only guarantees our compliance with all current and forthcoming legislation but delivers a JJI-Joist with excellent and continually improving environmental credentials.

Sustainable timber sourcing & chain of custody

Sustainable timber supply has always been integral to the manufacture of our engineered wood products. Consequently JJI-Joists are able to be specified as FSC® or PEFC™ certified. All product claims are independently verified by a certification body on an on-going basis.

Carbon Accounting and Life Cycle Assessment (LCA)

Our third key sustainability element is our Environmental product declaration (EPD) which has been independently verified according to the EPD International Method and it is managed by Environdec.

Through this EPD we can calculate the carbon capture within our JJI-Joists from individual house design to full supply contract volumes. Increasingly supply chain partnerships are being developed with key clients to enable our quantified carbon negative supply to support and contribute to downstream Corporate Social Responsibility (CSR) commitments.

To view our EPD please visit: www.environdec.com

Environmental Product Declaration (EPD)

Environmental Products Declarations (EPDs) are voluntary assessment documents that offer quantified information over a range of environmental impacts within the boundaries defined by companies, i.e. (greenhouse gases emissions, water usage and energy). They are produced using a Life Cycle Approach (LCA) using internationally accepted methodologies and they are independently reviewed which makes them more robust to stakeholder criticism.

Our LCA measurements enable our environmental performance profile to be measured and improved upon by assessing all environmental impacts associated with the sourcing, transport and manufacture of our product (i.e. from the forest to the end user).

Improved supply logistics, new resin formulations and improved biomass heating efficiencies are recent examples of targeted and quantifiable improvements within the life-cycle performance of our JJI-Joists.

Russwood offices-Newtonmore

Section 2

JJI-Joists

A JJI-Joist is a composite engineered timber joist, combining 45mm deep high-grade finger jointed softwood flanges with a 9mm thick oriented strand board (OSB/3) web.

Introduction

The JJI-Joist relies on a unique combination of engineered products designed to complement each other and deliver outstanding performance. These materials have different specific properties and by combining the two materials in this way to form a composite section you can use the strengths of each one where it is needed most. This results in the new section outperforming the individual materials that it is made from (the sum is greater than its parts) making it more structurally efficient.

Using advanced technology these components are combined to produce an innovative alternative to conventional construction timber with many additional advantages.

JJI-Joist Composition

Advantages

JJI-Joists are designed to give a superior strength to weight ratio when compared to traditional solid timber enabling the manufacture of longer and lighter structural members. The JJI-Joist, with a softwood flange:

- Is capable of spanning longer distances
- Is easier to handle
- Is easier to fix and nail
- Is less prone to splitting
- Is quicker to install
- Is extremely stable
- Reduces building maintenance
- Provides a less complex design solution
- Is simple to specify using product specific software
- Has Part E compliant details available
- Is FSC or PEFC accredited
- Has very low embodied energy
- Has independently assured carbon accounting to our Environmental Product Declaration (EPD)

JJI-Joist identification and marking

For onsite identification and traceability, all JJI-Joists are clearly marked with product and manufacturing information. The large markings on the OSB web detail the joist depth, flange size, manufacturing time/date and ETA product approval. Further information printed on the top and bottom timber flanges detail the timber strength class, chain of custody confirmation and a warning 'DO NOT CUT FLANGES'.

JJI-Joist flange sizes

JJI-Joist range

JJI-Joists are available in a comprehensive range of sizes, designed specifically for the UK market.

JJI-Joist Product Range UK				
Joist Depth mm	Flange sizes in mm			
	A+ 47	B+ 63	C 72	D 97
195	✓			
220	✓	✓	✓	✓
235	✓	✓	✓	✓
245	✓	✓	✓	✓
300	✓	✓	✓	✓
350				✓
400				✓

Table 1. JJI-Joist product range

JJI-Joist properties

It is possible to design JJI-Joist structures using either a Permissible Stress Design Code (BS 5268-2) or a Limit State Design Code (EN1995-1-1/Eurocode 5). Permissible stress design properties, intended for use with BS 5268-2 and characteristic capacities, intended for use with Eurocode 5, can be found in BM TRADA ETA 10/0335.

Joist Type	Depth	Bending moment capacity	Bending stiffness	Shear strength capacity	Shear stiffness	Intermediate bearing capacity – minimum 89mm bearing length		End bearing capacity – minimum 45mm bearing length		End bearing capacity – minimum 89mm bearing length		Weight per metre length

Table 2. Characteristic capacities for JJI-Joists (Eurocode 5)

Notes for Table 2:

- All strength properties are for joists acting as non-systems. For joist acting as a system multiply values by 1.1 ($K_{sys}=1.1$)
- Minimum end bearing length =45mm, minimum intermediate bearing length =89mm
- N/S: no web stiffeners required, W/S: Web stiffeners required
- Advice on choosing appropriate partial factors for limit state design can be found in ETA-10/0335
- Lateral buckling checks should be performed during the design of structures using JJI-Joists if both flanges are not fully restrained
- * Please contact James Jones & Sons for availability

Characteristic JJI-Joist vertical load capacities when fully supported

JJI Joist Depth	Characteristic load per metre run (kN/m)
195	75.0
220	75.0
235	71.0
245	64.0
300	60.0
350	41.0
400	32.0
450	31.0

Table 3. JJI-Joist vertical loads

Notes for Table 3:

- Values for point load can be calculated as $P=UDL \times (L_b +60)/1000$ where L_b is the contact length of the load applied in mm
- The beam is considered fully restrained, effects of buckling have been ignored
- Allowance may be made for load spreading of sole plates and bottom rails at the designers discretion

JJI POINT LOAD AND UDL

JJI-Joist hole installation guide: Circular, Square and Rectangular Holes

Service holes **MUST NOT BE CUT** in the JJI-Joist flange.

The maximum size of a service hole that can be cut in the web of a JJI-Joist at a particular location depends on the specific load configuration on the joist. The table below gives the minimum required distance, L (mm), from inside face of support to nearest edge of hole for uniformly loaded, simply supported joists under standard domestic loading of 0.75kN/m² dead load and 1.5kN/m² imposed load at up to 600mm centres. Where this is not the case, the hole(s) can be assessed using the JoistMaster software. Contact your distributor for advice.

Joist Depth (mm)	Joist Span (mm)	Hole Size (mm)													
		50		75		100		125		150		175		200

Table 4. Allowable Locations for Circular, Square and Rectangular Holes (Domestic Applications)

Notes for Table 4:

- Table 4 has been calculated for joists in intermediate domestic floors ($G_k=0.75\text{kN/m}^2, q_k=1.5\text{kN/m}^2, Q_k=2\text{kN}$) at 600mm centres
- Where more than one hole is to be cut, the minimum spacing between holes must be 2 times the width of the largest hole
- The rectangular hole width b should not exceed $1.5 \times D$
- Cut all holes carefully, do not overcut and do not cut flanges
- Where holes are required in rim and header joists of timber frame construction refer to the building designer
- Plastic plumbing is ideal with JJI-Joists. Where copper plumbing is to be used, careful consideration of the sequence of pipe installation is required
- The bearing support length used for this table is 45mm
- A 35mm hole may be drilled anywhere on the centre line of the web material provided there is a minimum of 35mm from the edge of the hole to the end of the joist and it is not directly over a support

Alternative solutions - reinforcing plates

For guidance on using reinforcing plates for large and highly loaded applications please contact your JJI-Joist distributor.

Acoustic requirements

JJI-Joists can be used in both intermediate and separating floors that comply with current building standards.

England and Wales, Building Regulations Part E (Resistance to the Passage of Sound), October 2015, Section 5: 5.23 Internal floor type C and Section 3: 3.1 Floor Type 3.1A.

Scottish Building Standards, Section 5 (Noise), October 2011, Scottish Government Example Construction and Generic Internal Constructions, Section 4.c: Floor Type 2 & 2A and Section 10: Floor Type 3B.

Intermediate floors

James Jones & Sons Ltd. have undertaken further acoustic tests to provide the builder with alternative solutions to that found in the above national standards. For further information please refer to Technical Bulletin 14 'Resistance to the Passage of Sound' for use in England and Wales and Technical Bulletin 38 '44dB Rw Acoustic Performance of 220mm JJI-Joist floor' for use in Scotland.

ENGLAND AND WALES INTERMEDIATE FLOOR

1. Floor Deck – 18mm flooring grade chipboard
2. Structural Member – 220mm deep JJI-Joists at a minimum 400mm centres
3. Ceiling – 15mm gypsum wall board and no board edge noggings
4. Also see fire requirements

SCOTLAND INTERMEDIATE FLOOR

1. 5mm bead of Caberfix joint and joist adhesive
2. 220mm JJI-Joist
3. 15mm Knauf Wallboard
4. 100mm Knauf acoustic roll
5. 22mm Caberdek P5 chipboard peel clean removed

Separating floor

JJI-Joists can be readily specified for use in separating floors in England and Wales and Scotland. Where increased performance with regard to acoustics, fire and the overall structure is required.

JJI-JOISTS IN TIMBER FRAME CONSTRUCTION COMPLYING WITH PART E1

Robust detail E-FT-1

1. 18mm chipboard and 19mm plasterboard plank
2. 70mm dynamic battens at 600mm centres
3. Minimum 25mm quilt between battens
4. Sub-deck board, minimum 15mm
5. 100mm mineral fibre based quilt
6. Resilient bar at 400mm centres
7. Minimum 235mm deep JJI-Joist at centres to suit span
8. 12.5mm plasterboard and 19mm plasterboard plank or 2 no. layers 15mm plasterboard

robustdetails®

- E-FT-1 (England and Wales Generic solution)
- E-FT-5 (England and Wales Collecta® ScreedBoard® 28)
- E-FT-7* (England and Wales FFT80)
- V-FT-1 (Scotland Generic solution)

There are currently 4 solutions where JJI-Joists can be fully incorporated into the makeup of separating floors to achieve Robust Detail status.

For further information www.robustdetails.com/

* Recommended that Building Control be consulted to ensure full compatibility with other NI Regulations and Standards.

Fire resistance

Successful fire tests have been carried out on JJI-Joists by International Fire Consultants Limited. Various solutions are available for half hour and one hour fire resistance performance to both European and British standards. The following details show examples of the approved floor constructions described in International Fire Consultants Assessment reports PAR/17613/01 to BS 476 and PAR/15150/01 &/02 to BS EN 1365.

Half-hour

30 MIN FIRE RESISTANCE

Ceiling-30 min

- 15mm Type A plasterboard fixed directly to joist
- 15mm Type F plasterboard fixed directly to joist
- 12.5mm Type F plasterboard fixed to resilient bars, maximum 450mm bar centres
- 12.5mm Type D plasterboard fixed to resilient bars, maximum 400mm bar centres

Floor Deck-30 and 60 min

- 22mm (for 600mm centres joists) and 18mm (for less than 450mm centres joists) flooring grade chipboard
- 18mm flooring grade plywood
- 18mm oriented strand board (OSB)
- 21mm T&G softwood flooring

Structural Member-30 and 60 min

- JJI-Joist designed to support the applied loads at 600mm centres

STA design guide to separating distances during construction

Design guidance is available for new JJI-Joists solutions for category C1 and C2 structures covered under the STA (Structural Timber Association) separating distances during construction. The STA's design guide to separating distances during construction is a multi-part document that provides comprehensive guidance on the mitigation of the potential risk posed by a fire in a timber frame structure whilst under construction, i.e. (prior to the installation of the finishings that usually provide fire resistance to the final building). For further information please refer to Technical Bulletin 51 'JJI-Joist fire solutions for use with the STA design guide to separating distances during construction'.

One-hour

60 MIN FIRE RESISTANCE

Ceiling-60 min

- 2no. 15mm Type F plasterboard fixed directly to joist
- 2no. 12.5mm Type F plasterboard fixed direct to joist, plus board edge noggins

Type A, D (enhanced acoustics) & F (enhanced fire resistance) plasterboards to BS EN 520.

Where services penetrate the plasterboard lining, i.e. downlighters, a fire rated unit of equivalent performance must be used. For alternative ceiling options please contact James Jones & Sons for information.

Treatment and durability

JJI-Joists are untreated and when used in a Service Class 1 or 2 environment, the ETA certificate advises that they may be taken to have a service life in excess of 50 years.

Preservative treatment

JJI-Joists are available with preservative treated timber flanges. This allows their use in Use Class 2 conditions in accordance with BS EN335-1, and Hazard Class 2 conditions in accordance with NHBC Standards, i.e. load bearing external wall studs and flat roof joists. This treatment does not affect the structural properties of the JJI-Joist. Please contact James Jones and Sons for further information.

Temporary erection bracing notes

The builder is responsible for identifying and minimising the risks involved in erecting JJI-Joists to ensure that the health and safety of all workers is maintained. Builders should be aware of the health and safety responsibilities imposed on them by the Construction (Design and Management) Regulations 2015. Proper erection procedures and bracing are vital to the safe construction of JJI-Joists floors. The following notes may assist builders in preparing a safety assessment.

1. Do not allow workers to walk on unbraced joists
2. Do not store building materials on unbraced joists
3. JJI-Joists should be erected straight and vertical. The maximum deviation from horizontal should not exceed 10mm and the maximum deviation from the vertical should not exceed 2mm
4. JJI-Joists are unstable until fully braced. Bracing includes: longitudinal binders, diagonal bracing, stability blocking, rim joist/rim boards
5. All longitudinal binders, diagonal braces, stability blocks, and hangers should be completely installed and fully nailed as detailed
6. Lateral strength should be provided by a diagonally braced and blocked system across at least 3 joists as shown in the Erection Bracing Details (diagram below). Additional braced and blocking systems should be provided at 12m spacing in long joist runs
7. Once a JJI-Joist floor has been fully braced, construction materials may be placed on the floor provided that the overall weight of material to be placed on a single joist does not exceed 250kg (200kg for 195mm deep joists). Please refer to Technical Bulletin 47, 'Loading out JJI-Joist Floors'
8. Flooring should be fully fixed to the JJI-Joists before additional loads are placed on the floor
9. The ends of cantilevers should be stabilised with longitudinal binders fixed to the top and bottom flanges

Installation guidelines

This diagram indicates temporary erection bracing only. It is applicable to both timber frame and masonry construction.

Stability blocking notes

- Use timber blocks or JJI-Joist blocking pieces
- Timber blocks to be minimum 38 x 125mm cut squarely and accurately to maintain joist spacing. Fasten with minimum 2 no. 3.35 x 65mm nails
- Stability blocks need to be fixed to 3 joists and cover a minimum distance of 1200mm
- Timber blocks in the diagonally braced systems are required in each run of joists and at cantilever supports
- When joists butt on an interior support, block both sets of joists
- Additional braced and blocked systems should be provided at 12m spacing in long joist runs

JJI-Joist site storage

Protect joists from the elements. Keep them dry

Use suitable lifting equipment to offload joist bundles

Store joists on edge

DO NOT store joists flat

Use supports at about 3.0m spacing to keep joists clean, level and above the ground

Transport joists on edge, not flat

DO NOT lift joists by top flange

DO NOT lift joists on the flat

Attention! The following conditions are not allowed

DO NOT hammer on the web or flange

DO NOT bevel cut the joists past the inside face of the wall

DO NOT support the joist on the web

DO NOT walk on joists until proper bracing is in place

DO NOT stack building materials on unbraced joists

DO NOT cut holes too close to each other – see hole installation guide

DO NOT split the flange, ensure proper toe nailing

DO NOT over-cut web holes

DO NOT use non-approved hangers

DO NOT cut or notch flanges

Stairwell hatch system

Designed as an alternative to sacrificial stairwell joists, the OCKWELLS Stairwell Hatch System provides a reusable GRP platform over stairwell openings. For further information contact your JJI-Joist distributor.

Section 3

Glulam and LVL

Glue laminated timber (Glulam) is a high grade beam product that is an ideal choice for high strength and stiffness applications for heavily loaded members.

Laminated Veneer Lumber (LVL) is an advanced wood product suitable for a wide range of structural applications. Available in two specifications; JJ-LVL-Beam and JJ-LVL-Rim, LVL is exceptionally strong for the most demanding of applications.

Introduction

JJ-Beam (Glulam) is a high specification engineered timber product made by gluing together strength graded timber laminations to make up larger sections and distribute the natural defects evenly throughout the volume. The laminations are finger jointed to allow long lengths to be formed. This results in a structural unit of great strength and dimensional stability. Glulam beams can be produced in a range of sectional sizes and are available from James Jones & Sons in lengths up to 12m.

Typical Glulam Sections

Characteristic values for JJ-Beam

JJ-Beam should be designed to Eurocode 5 and requires the use of characteristic values as shown in Table 6.

Characteristic Values			JJ-Beam	Units
Bending strength	edgewise, parallel to grain	$f_{m,k}$	32	N/mm ²
Tension strength	parallel to grain	$f_{t,0,k}$	19.5	N/mm ²
	perpendicular to grain edgewise	$f_{t,90,k}$	0.45	N/mm ²
Compression strength	parallel to grain	$f_{c,0,k}$	26.5	N/mm ²
	perpendicular to grain edgewise	$f_{c,90,k}$	3	N/mm ²
Shear strength	edgewise, parallel to grain	$f_{v,k}$	3.2	N/mm ²
	perpendicular to grain edgewise	$E_{0,mean}$	13700	N/mm ²
Modulus of elasticity	parallel to grain	$E_{0,05}$	11100	N/mm ²
	5% parallel to grain	$E_{90,mean}$	420	N/mm ²
Shear modulus	edgewise, parallel to grain	G_{mean}	780	N/mm ²
	edgewise, parallel to grain	$G_{0,05}$	540	N/mm ²
Density	characteristic	ρ_k	410	kg/m ³
	mean	ρ_{mean}	440	kg/m ³

Table 6. Characteristic Values for JJ-Beam

Care should be taken to ensure that all partial factors used to convert the characteristic values to design values are correctly chosen for the prevailing design conditions. For example, load duration, member depth, service class, etc.

Service Class	Load Duration Class					K_{def}
	Permanent	Long term	Medium term	Short term	Instantaneous	
1	0.60	0.70	0.80	0.90	1.10	0.6
2	0.60	0.70	0.80	0.90	1.10	0.8
3	0.50	0.55	0.65	0.70	0.90	

Table 8. K_{mod} and K_{def} factors for JJ-Beam and JJ-LVL

Note for Table 8:

- Values provided in BS EN 1995-1-1

JJ-Beam product range

JJ-Beam is supplied as part of the JJI-Joist system. It is available in depths that match the JJI-Joist range (Table 1) and three standard widths. See table below for standard range.

Intermediate widths can be achieved by fixing multiple settings together with suitably specified fixings.

Section Depth	Width		
	38	45	90
195	✓	✓	✓
220	✓	✓	✓
235	✓	✓	✓
245	✓	✓	✓
300	✓	✓	✓
350		✓	✓
400		✓	✓
450		✓	✓

Table 5. JJ-Beam product range

JJ-Beam vertical load characteristic capacities

Width	Characteristic load per metre run (kN/m)
38	114.0
45	135.0
90	270.0

Table 7. JJ-Beam vertical load characteristic capacities

Notes for Table 7:

- Values for point load can be calculated as $P=UDL \times (L_b + 60)/1000$ where L_b is the contact length of the load applied in mm
- The beam is considered fully restrained, effects of buckling have been ignored
- Factor $K_{c,90}$ has been taken as 1, however, allowance may be made for load spreading of sole plates and bottom rails at the designers discretion

JJ-BEAM AND JJ-RIM POINT LOADS AND UDL

Material	γ_M
Glulam	1.25
LVL	1.20

Table 9. γ_M material factors for JJ-Beam and JJ-LVL

Note for Table 9:

- Values provided in NA to BS EN 1995-1-1

Introduction

Laminated Veneer Lumber (LVL) is an advanced wood product suitable for a wide range of structural applications, from new build to repair. LVL as a material is exceptionally strong with a great load bearing capacity, homogeneous quality and good workability. JJ-LVL-Beam and JJ-LVL-Rim is available in 12m lengths and in a range of sizes.

Typical LVL Sections

LVL product range

JJ-LVL-Beam and JJ-LVL-Rim is available in depths to suit the JJ-Joist range (Table 1) and four standard widths depending on the grade. See table below for our standard range.

Section Depth	Width			
	JJ-LVL-Rim	JJ-LVL-Beam		
	30	39	45	75
195	✓	✓	✓	✓
220	✓	✓	✓	✓
235	✓	✓	✓	✓
245	✓	✓	✓	✓
300		✓	✓	✓
350			✓	✓
400			✓	✓

Table 11. LVL product range

Characteristic values for JJ-LVL-Beam and JJ-LVL-Rim

JJ-LVL-Beam and JJ-LVL-Rim should be designed to Eurocode 5 and requires the use of characteristic values as shown in Table 10.

Characteristic Values			JJ-LVL-Rim	JJ-LVL-Beam	Units
Bending strength	edgewise, parallel to grain	$f_{m,k}$	32	44	N/mm ²
Size effect parameter		s	0.15	0.15	-
Tension strength	parallel to grain	$f_{t,0,k}$	26	35	N/mm ²
	perpendicular to grain edgewise	$f_{t,90,k}$	6	0.8	N/mm ²
Compression strength	parallel to grain	$f_{c,0,k}$	26	35	N/mm ²
	perpendicular to grain edgewise	$f_{c,90,k}$	9	6	N/mm ²
Shear strength	edgewise, parallel to grain	$f_{v,k}$	4.5	4.1	N/mm ²
	parallel to grain	$E_{0,mean}$	10500	13800	N/mm ²
	5% parallel to grain	$E_{0,05}$	8800	11600	N/mm ²
Modulus of elasticity	perpendicular to grain edgewise	$E_{90,mean}$	2400	nd	N/mm ²
	edgewise, parallel to grain	G_{mean}	600	600	N/mm ²
Shear modulus	edgewise, parallel to grain	$G_{0,05}$	400	400	N/mm ²
	characteristic	ρ_k	510	510	kg/m ³
Density	mean	ρ_{mean}	480	480	kg/m ³

Table 10. Characteristic Values

Notes for Table 10:

1. nd= Parameter not declared by manufacturer
2. Properties valid for products within 24-75mm thickness
3. Properties declared in certificates 0809-CPR-1203 and 0809-CPR-1214

Design values for domestic flooring applications

Tables of calculated design values for JJ-Beam, JJ-LVL-Rim and JJ-LVL-Beam in all available sections and sizes can be provided on request, please contact James Jones and Sons.

LVL vertical load capacities when fully supported

Width [mm]	Characteristic load per metre run (kN/m)	
	JJ-LVL Rim	JJ-LVL Beam
30	270	-
39	-	234.0
45	-	270.0
75	-	450.0

Table 12. JJ-LVL-Beam and JJ-LVL-Rim vertical load characteristic capacities

Notes for Table 12:

1. Values for point load can be calculated as $P=UDL \times (L_b+60)/1000$ where L_b is the contact length of the load applied in mm
2. The beam is considered fully restraint, effects of buckling have been ignored
3. Factor $K_{c,90}$ has been taken as 1, however, allowance may be made for load spreading of sole plates and bottom rails at the designers discretion

JJ-LVL-BEAM AND JJ-LVL-RIM POINT LOADS AND UDL

Alternative sizes, grades and profiles

One of the benefits of partnering with two of Europe's largest engineered timber manufacturers is being able to offer an extensive range of Glulam and LVL products direct from their manufacturing bases in mainland Europe.

Glulam

Binderholz is a full-range supplier for glulam products, manufactured in accordance with EN 14080:2013, with beams and profiles available to the following strength classes for both visual and non-visual applications:

GL24c, GL24h, GL28c, GL28h, GL30c, GL30h, GL32c and GL32h

Glulam special profiles and treatments

We are able to offer a range of special architectural profiles including sloped and curved beams, plus a broad spectrum of secondary beam processing (notches, holes, etc). For a full list of products, grade and quality information please visit our website:

www.jamesjones.co.uk/products-and-services/engineered-timber/glulam

LVL

Partnering with Stora Enso allows us to offer their full range of LVL products. Manufactured in accordance with EN 14374, Stora Enso LVL is available in S, X and T grades in various billet sizes. For further information on LVL use and material and structural properties, please visit our website: www.jamesjones.co.uk/products-and-services/engineered-timber/lvl

Storage on site

Glulam and LVL will typically arrive on site with a moisture content between 10% and 15%, and will achieve a moisture content of approximately 12% when installed in Service Class 1 conditions.

Glulam and LVL should be stored clear of the ground on a flat level surface and protected from the weather.

Once installed, if the structure will not be weather tight for a prolonged period of time, the Glulam and LVL should be protected from the weather to avoid excessive changes in moisture content, and associated dimensional changes.

Treatment and durability

Our Glulam and LVL products are untreated. When used in a Service Class 1 or 2 environment they will have a natural durability comparable to that of solid European white wood.

Following discussions with the NHBC it has been confirmed that when used as a rim beam in timber frame construction and protected by a layer of sheathing and breather paper, no additional preservative treatment is required.

Check for compatibility before applying any preservative coating/treatment.

JJ-LVL-Beam can be supplied with an optional water-borne wood oil weather guard coating called Teknoshield. For further information contact your JJI-Joist distributor.

Fire resistance and treatment

For the purpose of calculating the fire resistance of Glulam and LVL members, detailed guidance on charring rate calculation procedures can be found in EN 1995-1-2.

Service holes in Glulam and LVL

Holes or notches should be formed in accordance with the guidelines given for solid timber members in The Building Regulations Approved Document "Timber Intermediate Floors for Dwellings", clause 2.5. The hole and notch diagram is applicable to uniformly loaded single span beams only. For all other applications, consult the JJI-Joist distributor.

Service hole diagram

In addition to the rules given above a 35mm circular hole can be drilled at any location along the centre line of a JJ-Beam and JJ-LVL member provided the following rules are observed:

- The hole must be a minimum of one member depth away from the end of the joist
- The hole must be a minimum of one member depth away from the nearest support
- No two adjacent holes should be located any closer together than 70mm edge to edge
- For holes larger than 35mm contact your distributor for advice

Larger holes and complex loading

PD6933-1-2012 provides a calculation method for larger holes up to 0.4 x depth of the joist. This method can be used for multi-span beams and complex loading conditions.

Fixing of multiply JJ-Beam and JJ-LVL-Beam Members

Multiply JJ-Beam and JJ-LVL members can be fixed together using nails, screws or bolts depending on availability and preference.

Screws – Where possible, James Jones & Sons recommend the use of large diameter self tapping screws in preference to nails or bolts. For details of the available screw sizes and advice on how they should be used please refer to the relevant metalwork manufacturer's technical literature (see page 2 for contact details).

For cases where large diameter self-tapping screws are not available this section provides some standard nailing and bolting details for uniformly loaded multiply members loaded from one face only e.g. (incoming joists on hangers at 600mm centres or less).

Nails – For two ply 38mm and 45mm members nails are the most cost effective and easily made fixing. Nails can also be used in three ply 38mm and 45mm members although designers are encouraged to use a screwed connection solution where possible.

Bolts – Bolts can be used to connect together up to 5 ply 45mm and 3 ply 75mm members.

Tables 13a and b give maximum medium term design line loads that can be carried if the following fixing details are used.

Fixing Ref.	Section Makeup - JJ-Beam	2 ply			3 ply		4 ply		5 ply	
		Ply Thickness (mm)	38	45	90	38	45	38	45	38
	Overall width (mm)	76	90	180	114	135	152	180	190	225
A	2 rows of 3.1mm nails (300 centres)	7.49	7.68	-	5.62	5.76	-	-	-	-
B	3 rows of 3.1mm nails (300 centres)	11.24	11.52	-	8.43	8.64	-	-	-	-
C	2 rows of M12 bolts (600 centres)	25.29	27.01	35.20	18.97	20.26	16.86	18.01	15.81	16.88
D	2 rows of M12 bolts (400 centres)	37.93	40.52	52.79	28.45	30.39	25.29	27.01	23.71	25.32
E	2 rows of M12 bolts (300 centres)	50.58	54.02	70.39	37.93	40.52	33.72	36.02	31.61	33.76

Table 13a. Maximum Medium Term Design Line Load (kN/m) for Multiply JJ-Beam Members Loaded from One Face

Notes for Table 13a and b:

- The values in the tables 13a and b are applicable to members loaded to one face only in floor applications
- Capacities for nail details are based on 3.1mm diameter power driven nails (75mm long for 38mm thick plies and 90mm long for 45mm plies), hammer driven nails up to 4.5mm diameter may be used
- 38mm diameter x 3mm thick washers are required under each head and nut on M12 bolts. Bolts to be minimum 4.6 grade
- Sections over 180mm wide should be loaded equally from both sides unless checked by an Engineer
- Bolt length to be no less than the overall width of beam + 18mm, e.g. a 2 ply 45mm member would require a 108mm bolt

Fixing Ref.	Section Makeup - JJ-LVL	2 ply			3 ply			4 ply		5 ply	
		Ply Thickness (mm)	39	45	75	39	45	75	39	45	39
	Overall width (mm)	78	90	150	117	135	225	156	180	195	225
A	2 rows of 3.1 nails (300 centres)	8.21	8.35	-	6.16	6.26	-	-	-	-	-
B	3 rows of 3.1 nails (300 centres)	12.32	12.53	-	9.24	9.40	-	-	-	-	-
C	2 rows of M12 bolts (600 centres)	28.44	30.33	38.08	21.33	22.74	28.56	18.96	20.22	17.78	18.95
D	2 rows of M12 bolts (400 centres)	42.66	45.49	57.12	32.00	34.12	42.84	28.44	30.33	26.67	28.43
E	2 rows of M12 bolts (300 centres)	56.89	60.65	76.16	42.66	45.49	57.12	37.92	40.43	35.55	37.91

Table 13b. Maximum Medium Term Design Line Load (kN/m) for Multiply JJ-LVL-Beam Members Loaded from One Face

Nails in two ply members should be fixed in two rows 45mm in from the top and bottom edge and one row along the centre line if required, driven from alternate sides.

NAILING PATTERN FOR 2 PLY JJ-BEAM AND JJ-LVL-BEAM MEMBERS

Nails in three ply members should be fixed in two rows 45mm in from the top and bottom edge and one row along the centre line if required, driven through each outer ply into the central one. Note that nails from any one face should be at the specified centres with the nails from the opposite face offset by half the centres distance.

NAILING PATTERN FOR 3 PLY JJ-BEAM AND JJ-LVL-BEAM MEMBERS

Bolts should be fixed in two rows 65mm in from the top and bottom edge. Bolt holes should be drilled at Ø12mm and bolts tapped into place.

BOLTING PATTERN FOR UP TO 5 PLY JJ-BEAM AND JJ-LVL-BEAM MEMBERS

Point loads

Multiply JJ-Beam and JJ-LVL members are often used as trimming joists parallel with the short edge of stairwells resulting in significant point loads from the trimmer. In situations like this where an isolated point load is to be carried by a multiply member, the designer needs to consider a localised fixing close to the incoming member. Tables 14 a and b give maximum medium term isolated design point loads that can be carried if the following fixing details are used.

NAILING PATTERN FOR 2 PLY JJ-BEAM AND JJ-LVL-BEAM MEMBERS WITH AN INCOMING POINT LOAD

NAILING PATTERN FOR 3 PLY JJ-BEAM AND JJ-LVL-BEAM MEMBER WITH AN INCOMING POINT LOAD

BOLTING PATTERN FOR JJ-BEAM AND JJ-LVL-BEAM MEMBERS (UP TO 4 PLY) WITH AN INCOMING POINT LOAD

Fixing Ref.	Section Makeup	2 ply			3 ply		4 ply	
		Ply Thickness (mm)	38	45	90	38	45	38
	Overall width (mm)	76	90	180	114	135	152	180
F	Nail Detail	13.50	13.80	-	10.10	10.40	-	-
G	Bolt Detail	30.30	32.40	42.20	22.80	24.30	20.20	21.60

Table 14a. Maximum Medium Term Isolated Design Point Load (kN) for Multiply JJ-Beam Members Loaded from One Face

Fixing Ref.	Section Makeup	2 ply			3 ply			4 ply	
		Ply Thickness (mm)	39	45	75	39	45	75	39
	Overall width (mm)	78	90	150	117	135	225	156	180
F	Nail Detail	14.78	15.04	-	11.09	11.28	-	-	-
G	Bolt Detail	34.13	36.39	45.70	25.60	27.29	34.27	22.75	24.26

Table 14b. Maximum Medium Term Isolated Design Point Load (kN) for Multiply JJ-LVL Members Loaded from One Face

Notes for Tables 14a and b:

1. The values in the tables above are applicable to members loaded to one face only in floor applications
2. Capacities for nail details are based on 3.1mm diameter power driven nails (75mm long for 38mm thick plies and 90mm long for 45mm plies), hammer driven nails up to 4.5mm diameter may be used
3. 38mm diameter x 3mm thick washers are required under each head and nut on M12 bolts. Bolts to be minimum 4.6 grade
4. Bolt length to be no less than the overall width of beam + 18mm, e.g. a 2 ply 45mm member would require a 108mm bolt

Section 4

Floor design

Since their introduction into the UK in 1999, I-Joists have become the floor system of choice for the majority of the major house builders and JJI-Joists are the market leader. The JJI Design system ensures that the optimum combination of performance and price is achieved first time every time.

Factors affecting floor performance

The following list describes factors that affect floor performance and consideration of these factors may be helpful when designing and installing a JJI-Joist floor system:

Joist depth

Deeper joists create a stiffer floor thereby reducing deflection. A deep floor joist solution may in fact be cheaper than a shallow joist solution as you may be able to use thinner joists at wider centres.

Deck fixing

A correctly nailed/screwed floor deck will improve floor performance by about 12%*. Gluing the floor deck to the joists, and gluing tongued and grooved joints is required by NHBC Standards Section 6.4.19. In addition, the floor performance can improve by as much as 70% when the floor deck is glued to the joists*.

Deck thickness

Thicker floor deck material will improve the floor performance.

Ceiling treatments

Directly applied ceiling finishes will improve floor performance by about 3%*.

Blocking

Full depth blocking will improve floor performance.

Workmanship

Good quality workmanship is essential to achieve good floor performance. The provision of well prepared and level bearings, methodical erection procedure, diligent installation of all fixings and in particular fixing of the floor deck (including gluing where required) will have a significant effect on floor performance. The maximum acceptable tolerance on the level of bearings is +/- 3mm.

* Figures obtained from independent laboratory tests originating from a government (DETR) research project.

Special consideration for ground floor design

Timber in ground floor construction is in a more moist environment than timber in an upper floor. As such, JJI-Joists for use in ground floors should be designed using joist properties for Service Class 2 conditions.

F44 | TYPICAL MASONRY GROUND FLOOR DETAIL

- Internal ground covering to comply with Building Regulations
- Insulation in floor void omitted for clarity

Insulation

Thermal insulation is required in all ground floors and each different building type should be assessed individually to identify the specific U-value requirements and thus the corresponding thickness of insulation to be used. Three options for providing ground floor insulation are as follows:

- Quilt insulation supported on plastic netting or breather membrane
- Quilt insulation supported on a board fixed to the top side of the bottom flange of the JJI-Joist
- Solid insulation supported on bottom flange of the JJI-Joist

Most heat loss through a ground floor occurs around the floor perimeter and so the inclusion at the edges helps maintain overall insulation levels.

Resistance to moisture

All suspended ground floors should be constructed to resist the ingress of moisture. Where external ground level is above the ground cover level, then the ground cover should be laid to fall to a suitable drainage outlet.

Ventilation

All parts of the void underneath the suspended floor require a ventilation path to the outside. The ventilation openings should be at least 1500mm² for each metre run of two opposite sides of the floor, or alternatively in Scotland, an opening area 500mm² for every 1m² of floor area may be provided.

Radon gas

The construction of suspended timber ground floors in areas affected by Radon gas requires specialist advice.

Domestic floor span tables

The domestic intermediate floor span table below is based on the following design criteria:

- Dead Load including partition allowance is 1.35kN/m² for apartments or 0.75kN/m² for houses
 - The spans given are for simply supported and uniformly loaded joists only
 - Where the load conditions are different to those described, refer to the JJI-Joist supplier for further assistance
 - The joists are designed using the principles of EN1995-1-1 (Eurocode 5)
 - Adequate lateral restraint to the top flange of the joists is assumed to be provided by the floor deck
- Further details are provided in the notes below the table

Joist Type	Apartments			Houses		
	Dead Load up to 1.35kN/m ²			Dead Load up to 0.75kN/m ²		
	Joists Centres (mm)			Joists Centres (mm)		
	400	480	600	400	480	600

Table 15. Maximum Engineering Span for Domestic Intermediate Floors

Notes for Table 15:

1. This table serves as guidance only. For a more detailed JJI-Joist appraisal contact a JJI-Joist distributor. The calculated spans are engineering spans in mm
2. This table has been calculated for domestic intermediate floors (Service Class 1)
3. Load combinations equations 6.10aSTR 6.10bSTR (EN1990) have been used in this table
4. The effect of partition load has been included where the self-weight of the floor does not exceed 1.0kN/m² for apartments or 0.4kN/m² for houses
5. The calculated spans are engineering spans for simply supported joists with a medium term imposed load (qk=1.5kN/m², Qk=2.0kN)
6. Adequate lateral restraint is provided by the floor deck (22mm chipboard and 15mm plasterboard)
7. It is assumed that load can be shared between floor joists ($K_{sys}=1.1$)
8. Joists design values have been calculated using K_{mod} factors from table 3.1 (EN1995) and $V_{M,timber}=1.3, V_{M,osb}=1.2$
9. Final deflection limit has been taken as L/250. No additional instantaneous deflection limit has been applied
10. The unit load deflection limit is 1.8mm for spans below 4000 and $16500/L^{1.1}$ for spans over 4m
11. Fundamental frequency has been limited to 8Hz
12. The modal dampening ratio is 0.02
13. The floor width has been taken as 4m for velocity response checks
14. To achieve stated span, adequate bearing will be required. Web stiffeners may be necessary
15. Permissible web holes to be drilled in accordance to JoistMaster software or hole chart
16. * Please contact James Jones & Sons for availability

Example of JJI-Joist floor system

See notes and details for temporary erection bracing and procedure

When cantilever situations exist refer to specific details provided by the JJI-Joist distributor

For any construction situation not addressed by the following floor details, please contact the JJI-Joist distributor

Refer to table 4 for hole installation chart

F1 | CONTINUOUS JJI-JOIST ON WALL

Web stiffeners may be required, see F22

F2 | SPLIT JJI-JOIST ON WALL

Where split joist(s) of different widths meet on the wall a double row of blocking is required to suit joist widths

F3 | WALL AT 90° TO JJI-JOISTS

The floor designer is responsible for ensuring the joist design is adequate to support the wall

F4 | NON-LOAD BEARING WALL PARALLEL TO JJI-JOISTS

38 x 75mm nogging/dwang or JJI-C flange at maximum 600 c/c attached with 2 no. 3.35 x 65mm nails skew nailed at each end, alternatively use approved clips

The floor designer is responsible for ensuring the joist design is adequate to support the wall

F5 | INTERMEDIATE BEARING WITH LOAD BEARING WALL ABOVE

Refer to F detail notes - timber frame (see page 30)

F6 | TERMINATING JJI-JOIST ON WALL

Suitable detailing required if used on an external wall

F7 | JJI-JOIST BEARING IN BLOCK WALL

Construct blockwork around joist and fill all voids with web fillers, mortar and point with mastic sealant
Alternative proprietary systems may be used if approved by JJ&S
Restraint straps will be required for greater than 2 storeys*
*Straps required on all floors

F8 | MASONRY WALL RESTRAINT JJI-JOIST PARALLEL DETAIL 1

RESTRAINT STRAPS ARE THE RESPONSIBILITY OF THE BUILDING DESIGNER

F9 | MASONRY WALL RESTRAINT JJI-JOIST PARALLEL DETAIL 2

F10 | WALL RESTRAINT, BLOCK WALL HANGER SUPPORT

F11 | JJI-JOIST BEARING ON EXTERNAL WALL

Refer to F detail notes - timber frame (see page 30)

F12 | JJI-JOIST BEARING ON EXTERNAL WALL

Only applicable where a maximum of one storey is built above
Refer to F detail notes - timber frame (see page 30)

F13 | JJI-JOIST PARALLEL TO EXTERNAL WALL

Only applicable where a maximum of one storey is built above
Refer to F detail notes - timber frame (see page 30)

F14 | SINGLE JJI-JOIST TO JJI-JOIST

Approved face or top fix hanger secured through specified nail holes (refer to approved connector manufacturer's guidelines)

RESTRAINT STRAPS ARE THE RESPONSIBILITY OF THE BUILDING DESIGNER

F15 | SINGLE JJI-JOIST TO MULTIPLE JJI-JOIST

F16 | SINGLE JJI-JOIST TO JJI-JOIST (LIGHT LOAD)

F17 | MULTIPLE JJI-JOIST TO MULTIPLE JJI-JOIST

F18 | JJI-JOIST TO ENGINEERED TIMBER

F19 | FILLER BLOCK – DOUBLE OR TREBLE JJI-JOIST

Provide filler blocks at all ends and bearings of joiist and at points of incoming loads (see F15). Alternatively provide continuous filler block when repeated loads are applied (see detail F40)

F20 | FILLER AND BACKER BLOCK TABLE

JJI-Joist Depth (mm)	Filler and backer block depth (mm)	JJI-Joist Flange Type	Backer block/web stiffener thickness (mm)	Filler block thickness (mm)
195	100	A+	19	38
220	125	B+	27	54
235	145	C	32	63
245	150	D	44	2x44
300	200			
350	125+125			
400	150+150			
450	200+150			

Refer to details provided by the JJI-Joist supplier for required locations of filler and backer blocks
Where a continuous filler block is used (see detail F40)

Filler and backer blocks should be kiln dried timber, structural grade plywood or OSB/3

F21 FILLER AND BACKER BLOCK NAILING DETAIL

● Denotes nails from rear face
○ Denotes nails from front face

All filler and backer blocks for face fix hangers to be fixed tight to bottom flange with a minimum 3mm gap at the top. Backer blocks for top fix hangers to be fixed tight to the top flange with a minimum 3mm gap at the bottom.

Flange Spec	Backer Block	Filler Block
A+	65	65
B+	65	90
C	90	90
D	90	90

Minimum nail diameter 3.1mm

F22 WEB STIFFENER

19 thick for JJI A+ -65mm nails
27 thick for JJI B+ -65mm nails
31 thick for JJI C -65mm nails
44 thick for JJI D -90mm nails

100mm wide plywood, OSB/3 or kiln dried timber stiffener block fitted to both sides

F23 COMPRESSION BLOCK

Compression blocks are required where indicated on details provided by JJI-Joist supplier

F24 CANTILEVER

Back span of cantilever must be at least 3 times the cantilever length
1.2m maximum cantilever length

F25 STAIR STRINGER CONNECTION

F26 JJI-JOIST SUPPORTED ON STEEL/CORBEL WALL

F27 | LOAD BEARING WALL PARALLEL TO JJI-JOIST RUN

F28 | NEWEL POST TO JJI-JOIST TRIMMER

F29 | JJI-JOIST TO STEEL BEAM FACE FIXING

Approved face fixed hangers fixed through all nail holes
Refer to approved metalwork supplier's literature for further information

F30 | JJI-JOIST TO STEEL BEAM/MASONRY

Do not fix joist to steel lintels unless approved by lintel manufacturer
Bottom of hanger must rest against bottom flange of steel beam
Refer to approved metalwork supplier's literature for further information

F31 | JJI-JOIST TO STEEL BEAM TOP FIXING

Bottom of flange must rest against bottom flange of steel beam
Do not fix joist to steel lintels unless approved by lintel manufacturer
Refer to approved metalwork supplier's literature for further information

F32 | JJI-JOIST BEARING ON PARTY WALL

Refer to F detail notes - timber frame (see page 30)

RESTRAINT STRAPS ARE THE RESPONSIBILITY OF THE BUILDING DESIGNER

F33 | JJI-JOIST PARALLEL TO PARTY WALL

Overall minimum thickness of solid rimboard and blocking to be 76mm

Refer to F detail notes - timber frame (see page 30)

F34 | INDICATIVE DISPROPORTIONATE COLLAPSE JJI-JOISTS AT 90° TO WALL

Specification to Engineer's detail

F35 | INDICATIVE DISPROPORTIONATE COLLAPSE JJI-JOIST PARALLEL TO WALL

Specification to Engineer's detail

F36 | JJI-JOIST PARALLEL TO EXTERNAL WALL

Additional blocking may be required to provide adequate structural performance, to engineer's detail

Refer to F detail notes - timber frame (see page 30)

F37 | FLOOR CASSETTE JOINING DETAIL**TIMBER FRAME DETAIL NOTES**

1. See Tables 3, 7 and 12 for vertical load capacities
2. Rimboard thickness to timber frame kit manufacturer's Consulting Engineer's specification/approval
3. Rimboard fixed to bearing with 3.35 x 65mm nails at 150mm c/c
4. Secure rimboard to JJI-Joist with 2 no 3.35 x 65mm ring shank nails, one each to top and bottom flanges
5. Fix JJI-Joist to bearing with 2 no. 3.35 x 65mm nails, 40mm from joist end
6. Minimum joist bearing length 45mm
7. Ensure the Building Designer is satisfied with fixing between the wall and floor

F39 | ENHANCED HANGER UPLIFT

Approved face or top fix hanger secured through specified nail holes

F40 | CONTINUOUS FILLER BLOCKS

A continuous filler block should be utilised with multiple incoming loads
A continuous backer block could also be provided
Where continuous filler block is used, fix with 2 rows of nails at 300mm centres from both faces

F41 | BACKER FREE JJI-JOIST TO JJI-JOIST

Approved backer free hanger secured through specified nail holes
Refer to approved connector manufacturer's guidelines

F42 | FIXING DOUBLE OR TREBLE JJI-JOISTS

Refer to approved metalwork supplier's technical literature for specification and installation guidelines

F43 | FIXING DOUBLE JJI-JOISTS

Refer to approved metalwork supplier's technical literature for specification and installation guidelines

F45 | MASONRY RESTRAINT HANGER DETAIL 1

Refer to approved metalwork supplier's technical literature for specification and installation guidelines

FOR F44 SEE PAGE 22

RESTRAINT STRAPS ARE THE RESPONSIBILITY OF THE BUILDING DESIGNER

F46 | MASONRY RESTRAINT HANGER DETAIL 2

Nogging/dwang (min 38 x 45mm) securely fixed with 3.35 x 65mm skew nailing or approved clip

Refer to Simpson Strong-Tie's technical literature for specification and installation guidelines

F47 | SST END CAP AIRTIGHTNESS DETAIL

Nogging/dwang (min 38 x 45mm) securely fixed with 3.35 x 65mm skew nailing or approved clip

Refer to Simpson Strong-Tie's technical literature for specification and installation guidelines

F48 | ITW GRIPPER AIRTIGHTNESS DETAIL

Nogging/dwang (min 38 x 45mm) securely fixed with 3.35 x 65mm skew nailing or approved clip

Refer to ITW's technical literature for specification and installation guidelines

F49 | JJI-JOIST BEARING ON EXTERNAL WALL LOW LOAD

18mm external grade structural plywood

JJI-Joist, Glulam/LVL blocking offcuts

Web of blocking material must be fully supported

Alternatively use Glulam/LVL blocking in lieu of JJI-Joists
JJJ-Joist blocking offcuts can be of any joist width

F50 | JJI-JOIST PARALLEL TO EXTERNAL WALL LOW LOAD

18mm external grade structural plywood

JJI-Joist, Glulam/LVL blocking offcuts

Minimum 3.1 x 90mm nails

Web of blocking material must be fully supported
Maximum 610mm

F51 | JJI-JOIST PARALLEL DETAIL - SPROCKETS

Glulam/LVL or other engineered timber

JJI-Joist blocking sprockets

Minimum 3.1 x 90mm nails

Refer to F detail notes - timber frame (see page 30)

RESTRAINT STRAPS ARE THE RESPONSIBILITY OF THE BUILDING DESIGNER

Section 5

Roof design

By making the most of their long spanning capabilities, JJI-Joists are ideally suited for use in roofs. This allows the designer the freedom to create large open room spaces without the need for additional supports.

Design considerations

Unlike a floor design, a full roof design requires many additional considerations due to its location on the exposed envelope of the building and potentially complex geometry. Unlike floors, a roof is exposed to direct wind and snow loading.

Loading

Dead loads should be calculated for each job based on the specific roof makeup. Refer to BS 648 Weights of Building Materials or manufacturers literature for material data.

Imposed snow and wind loads should be based on the location of the building if known or alternatively on conservative estimates. EN 1991-1-3 and EN 1991-1-4 should be used for snow and wind loading respectively.

Joist Stability

Roofs should be braced during the erection process. Refer to temporary erection bracing notes, (See page 11). The compression flange of the JJI-Joist requires lateral restraint at regular centres to prevent lateral buckling. This can be achieved by using a permanent structural sarking layer directly fixed to the joist or alternatively by battens/furring strips fixed perpendicular to each joist.

Where a wind load analysis indicates that the rafters will experience a stress reversal under wind suction loads, care should be taken to ensure that the bottom flange of the joist is suitably restrained. This can be achieved by, for example, directly applying a ceiling/soffit lining to the underside of the joists.

Blocking or cross-bracing (see Roof Detail R10) may be required at support locations unless joists are held in place by alternative means.

Building Stability

Lateral restraint to gable walls etc. can be provided using details similar to those used for floors.

Racking of the whole roof structure should be prevented by the use of structural sarking or a system of triangulated bracing (this is required where only felt and tiling battens are used).

Deflection Limits

When considering member deflection a maximum limit of $L/250$ as defined in the UK national annex to EC5 is recommended. When a finished ceiling is applied to the underside of the roof, for long spans, the designer should consider restricting the maximum deflection further to avoid damage to the finishing. The designer should also consider a more strict deflection limit for principal members such as ridge beams and purlins to minimise combined deflection.

Fixings

Fixing JJI-Joists to supports needs careful consideration to account for axial, tangential, horizontal and vertical loads. Particular care should be taken when considering uplift forces due to wind suction.

Responsibilities

A full roof design will address all the above issues, however, they may be dealt with by different parties (Roof Component Designer, Roof Designer, Building Designer). It is vital that the responsibility of each party is clearly defined at the start of the design process.

Example of JJI-Joist flat roof system

See notes and details for temporary erection bracing and procedure

For any construction situation not addressed by the following floor details, please contact the JJI-Joist distributor

Cold roof vs warm roof design

A traditional cold roof design positions the insulation layer between or below the JJI-Joist rafters. This places parts of the roof structure above the insulation in a cold environment, with the potential for condensation when warm air permeates through. Adequate roof space ventilation must be provided to remove this air.

A warm roof is a modern alternative to a cold roof. A warm roof design places the insulating layer above the JJI-Joist rafters, or above and between the JJI-Joist rafters. A warm roof design will make the entire structure of the building warm in order to avoid cold bridging (an element of the building that allows heat or energy loss).

COLD ROOF

- 1. Deck/roof covering
- 2. Insulation
- 3. JJI-Joist rafter
- 4. Ceiling lining

WARM ROOF

- 1. Deck/roof covering
- 2. Insulation
- 3. Vapour control layer/sub-deck
- 4. JJI-Joist rafter
- 5. Ceiling lining

JJI-Joist flat rafters

The following span table is for JJI-Joists in flat rafter applications, joists designed using the principles of Eurocode 5 limit state design code (BS EN1995-1-1). Alternative span tables, including those to BS5268-2 can be found on our website.

Joist Type	Dead Load up to 0.5kN/m ²				Dead Load up to 0.75kN/m ²				Dead Load up to 1kN/m ²				Dead Load up to 1.5kN/m ²

Table 16. Maximum engineering span for JJI-Joist flat rafters

Notes for Table 16:

- This table serves as guidance only. For a more detailed JJI-Joist appraisal contact a JJI-Joist distributor. The calculated spans are engineering spans in mm
- This table has been calculated for cold flat roof (Service Class 2), category H (access only for maintenance)
- Load combinations equations 6.10aSTR 6.10bSTR (EN1990) have been used in this table
- Loads include imposed loads $q_k=0.6\text{kN/m}^2$, $Q_k=0.9\text{kN}$ and snow load 0.75kN/m^2 . No wind allowance has been considered in this table
- The calculated spans are engineering spans for simply supported joists
- It has been assumed that adequate lateral restraint is provided to top and bottom flanges
- It is assumed that load can be shared between floor joists ($K_{sys}=1.1$)
- Joists design values have been calculated using K_{mod} factors from table 3.1 (EN1995) and $\gamma_{M,timber}=1.3, \gamma_{M,osb}=1.2$
- Final deflection limit has been taken as $L/250$. No additional instantaneous deflection limit has been applied
- There is no allowance for overhangs within this table
- To achieve stated span, adequate bearing will be required. Web stiffeners may be necessary
- Permissible web holes to be drilled in accordance to JoistMaster software
- * Please contact James Jones & Sons for availability

JJI-Joist pitched rafters

The following span table is for JJI-Joists in pitched rafter applications, joists designed using the principles of Eurocode 5 limit state design code (BS EN1995-1-1). Alternative span tables, including those to BS5268-2 can be found on our website.

Support Requirements

When designing a JJI-Joist pitched rafter the designer should ensure that there are at least two vertical supports under the rafter. Typically these would be a load bearing wall or ridge beam at the top end and a load bearing wall at the lower end. Additional intermediate supports may be provided by, for example, purlins. It is possible to design the JJI-Joist rafters with only one support at the lower end if the top end (Ridge) is resting on another rafter leaning in the opposite direction. This, however, leads to horizontal reactions at the lower end and higher axial loads that need to be considered by a qualified engineer.

Definition of engineering span for JJI-Joist rafters

Joist Type	Dead Load up to 0.5kN/m ²			Dead Load up to 1kN/m ²			Dead Load up to 0.5kN/m ²			Dead Load up to 1kN/m ²		
	400mm centres						600mm centres

Table 17. Maximum engineering span for JJI-Joist pitched rafters (400 and 600 centres)

Notes for Table 17:

- This table serves as guidance only. For a more detailed JJI-Joist appraisal contact a JJI-Joist distributor. The calculated spans are engineering spans in mm
- This table has been calculated for cold pitched roof (Service Class 2), category H (access only for maintenance)
- Load combinations equations 6.10aSTR 6.10bSTR (EN1990) have been used in this table
- Loads for roof with 15° and 30° pitch include imposed loads $q_k=0.6kN/m^2$, $Q_k=0.9kN$ and snow load $0.75kN/m^2$
- Loads for roof with 45° pitch include imposed loads $q_k=0.3kN/m^2$, $Q_k=0.9kN$ and snow load $0.75kN/m^2$
- No wind allowance has been considered in this table
- The calculated spans are engineering spans measured on plan for simply supported joists
- It has been assumed that adequate lateral restraint is provided to top and bottom flanges
- It is assumed that load can be shared between floor joists ($K_{sys}=1.1$)
- Joists design values have been calculated using K_{mod} factors from table 3.1 (EN1995) and $\gamma_{M,timber}=1.3, \gamma_{M,osb}=1.2$
- Final deflection limit has been taken as $L/250$. No additional instantaneous deflection limit has been applied
- There is no allowance for overhangs within this table
- To achieve stated span, adequate bearing will be required. Web stiffeners may be necessary
- Permissible web holes to be drilled in accordance to JoistMaster software
- Figures followed by L denote engineering spans limited by maximum manufactured length of 12m
- * Please contact James Jones & Sons for availability

Example of JJI-Joist roof system

For any construction situation not addressed by the following roof details, please contact the JJI-Joist distributor

R1 | JJI-JOIST BEARING LENGTHS

Minimum end bearing

45mm*

Minimum intermediate bearing

89mm*

*Minimum bearing required by JOIST DESIGN. Consult building/roof designer for building stability requirements

R2 | BIRDSMOUTH CUT

Permitted at low end of JJI-Joist only

Bevelled ply/timber web stiffener each side of JJI-Joist web. Fix in accordance with detail F22
Do not bevel cut the JJI-Joist past the inside face of wall
Blocking omitted for clarity

R3 | BEVELLED SUPPORT PLATE FOR PITCHES UP TO 45°

JJI-Joist or Glulam/LVL blocking panel (see R10 for ventilation holes)

Maximum overhang to be 1/3 of adjacent span. If overhang to be modified use detail R5

R4 | ADJUSTABLE SEAT CONNECTOR FOR PITCHES 15°-45°

JJI-Joist or Glulam/LVL blocking panel (see R10 for ventilation holes)

Approved connector

Maximum overhang to be 1/3 of adjacent span. If overhang to be modified use detail R5

R5 | LOOSE TIMBER OVERHANGS

Solid timber overhang for soffit supports

Filler

Bevelled solid timber block

Bevelled web stiffeners on both sides if joist birdsmouthed over wallplate

R6 | DOWNSTAND RIDGE BEAM

Restraint strap (ITW or Simpson Strong-Tie)

Double bevelled support plate

JJI-Joist/Glulam/LVL ridge beam or support wall/steel beam

18 x 200mm OSB splice block one side only, fix with 6 no. 3.35 x 65mm nails, clenched (optional)

JJI-Joist/Glulam/LVL blocking panels (For ventilation guidance, see R10)

R7 | FLUSH RIDGE BEAM

Glulam/LVL ridge beam

Restraint strap

Approved sloped hanger

Ply/timber bevelled web stiffener required on each face. Fix in accordance with F22

R8 | OPENING IN ROOF

Filler block fixed in accordance with F15 and F21

Backer block fixed in accordance with F15 and F21

Restraint strap

Full depth face fix hanger (see detail F14 and F21)

R9 | GABLE LADDER

R10 | BLOCKING AND VENTILATION HOLES

R11 | FLUSH PURLIN BEAM

R12 | JJI-JOIST RAFTER FIXING TO WALL PLATE

R13 | JJI-JOIST RAFTER TERMINATING ON DOWNSTAND RIDGE BEAM

R14 | JJI-JOIST RAFTER TERMINATING ON DOWNSTAND STEEL BEAM

Section 6

Wall design

JJI-Joists are ideally suited for use as wall studs where their availability in depths up to 450mm allows designers to insulate external walls to unprecedented levels. Even when shallower joists are used the narrow web profile provides a restricted path to heat transfer (reduced repeated thermal bridging) when compared with solid timber.

Design considerations

Where the wall is subjected only to horizontal wind loads with no vertical axial loads (e.g. ground level to eaves level infill panels in a portal frame structure) JJI-Joists allow very tall walls to be built using a continuous structural member.

James Jones & Sons recommend that JJI-Joists are incorporated into prefabricated wall panels in order to take advantage of the improved precision and quality typically available in a factory environment.

For further information on axial compression strengths please contact James Jones & Sons.

Each timber frame kit manufacturer will typically produce their own set of standard details to suit their specific production, manufacturing and technical requirements.

The structural design of JJI-Joist studs should be undertaken by a suitably qualified engineer who should pay particular attention to buckling restraint, axial load distribution between inner and outer flanges and member to member fixings.

It is our recommendation that the use of JJI-Joist studs is best suited to external wall closed panel type manufacturing with a separate service zone on the inside face of the internal sheathing. The lightweight nature of JJI-Joists permits the construction of larger panels than might otherwise be possible reducing the number of site lifts required.

Particular care should be taken when insulating to avoid cold spots.

Thermal performance of JJI-Joists used in the external envelope of a building

There are many possible ways to utilise JJI-Joists in the external envelope of a building. The thermal performance of any chosen configuration and material combination should be assessed by a suitably qualified person.

The U-Value of a detail is highly dependant on the quality of the insulation material used. The key property of the insulation in this respect is the conductivity (λ - Value) which varies from material to material and across different forms and densities of the same material. A selection of common insulation materials is provided below showing the range of λ - Values indicated in the manufacturer's literature.

Conductivity (λ -values) for some common insulation materials

Notes:

1. Values shown were obtained from a review of publicly available product information
2. List of materials is not intended to be exhaustive
3. These materials can be purchased in different forms (i.e slabs, batt, roll, loose...)
4. Always refer to manufacturer's published data

The following illustration details the heat transference through a typical JJI-Stud wall, construction as shown above right.

Whilst it can be seen that the JJI-Joist web conducts more heat than the surrounding insulation, the limited cross section of the 9mm OSB web, when compared to a typical solid timber stud, greatly reduces repeated thermal bridging.

Typical JJI-stud external timber frame wall

1. Masonry 100mm
2. Air Cavity 50mm
3. Wood based board 9mm
4. JJI-Stud
5. Insulation material
6. Wood based board 9mm
7. Softwood batten 38 x 25
8. Service void
9. Plasterboard 12.5mm

Note: Vapour barriers, breather paper and wall ties omitted for clarity

The graph below can be used to relate the U-Value for a wall based on its thickness (JJI-Joist depth) and λ - Value of the chosen insulation.

Notes:

1. U-Values are calculated for the typical JJI-stud external wall detail (see above)
2. All U-Values have been calculated according to BS EN ISO 6946
3. JJI A+ studs at 600mm centres
4. Insulation is assumed to completely fill the JJI-Joist web void
5. Conductivity (λ -Values) are given in W/mK

For further information on thermal performance of JJI-Joists structures please contact James Jones & Sons.

W2 | INTERMEDIATE FLOOR TO WALL JUNCTION

W3 | EXTERNAL WALL CORNER JUNCTION

W4 | EXTERNAL WALL, INVERTED CORNER

W5 | STRUCTURAL OPENING

W6 | INTERNAL TO EXTERNAL WALL JUNCTION

James Jones & Sons Ltd is one of the UK's largest and most progressive timber companies with core activities in sawmilling, JJI-Joist and pallet manufacture. We operate five sawmills in Scotland; an engineered wood manufacturing plant in the north of Scotland and have pallet and packaging operations at fifteen sites across the UK. We produce high quality, British grown sawn timber for the construction, pallet, packaging, fencing and agricultural sectors and pallets and packaging for blue chip domestic and exporting businesses. In addition, we are the market leaders in the supply of JJI-Joists to many of the UK's top house builders.

Our Timber Systems Division is the UK's largest manufacturer of FSC® certified I-Joists, branded as JJI-Joists.

Certification/Approvals:

JJI-Joists are an accepted building material within the European construction industry due to third party accreditation and certification.
